Where does Cuba's energy supply come from?

Cuba's energy supply mainly comes from oil products, accounting for over 80% of power generation.

What is the energy consumption column in Cuba?

Electricity production of Cuba in 2015 sorted by technologies and resources, the energy consumption column corresponds to the primary resources needed to produce the amount of electricity in the column called electricity production with the current Cuban energy system. Thermoelectric power plants have an installed capacity of 2.59 GW.

Why does Cuba have a bad energy system?

Cuba's energy system also suffers from years of reliance on domestic, poor-quality heavy crude oil, which is corrosive because it's high in sulfur. This has accelerated the wear and tear on boilers, turbines, and pipes in Cuba's power plants, shortening their life spans and causing frequent and costly outages.

How is energy used in Cuba?

Total energy supply (TES) includes all the energy produced in or imported to a country, minus that which is exported or stored. It represents all the energy required to supply end users in the country.

To come out of the recurring electricity crisis, Cuba is striving to replace fossil fuel-powered power plants by prioritising renewable energy sources.
