How difficult is the energy transition in Central Asia?

The energy transition implies difficult political decisions that governments and societies are not fully ready for. It also requires enhanced regional cooperation and coordination that would allow Central Asian countries to have more diversified and reliable energy systems. The obstacles are substantial but not unsurmountable.

Are Central Asia's energy grids running down?

Energy grids in Central Asia, inherited from the Soviet times, are run down and ineffective. Major investments are needed for upgrading them and making them sufficiently flexible to integrate intermittent resources into national power systems.

Is there a green transition in Central Asia?

At present, there is an alignment of domestic, regional, and international factors conducive to making substantial progress in the green transition in Central Asia. In October 2022, the Program on Central Asia launched the Renewable Energy Transition in Central Asia (RETCA) project to support the transition to renewables in Central Asia.

What are the environmental challenges facing Central Asia?

Renewable Energy in Central Asia Context Five countries of Central Asia - Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan - face significant environmental challenges, including high levels of pollution and impacts of climate change.

Central Asian countries should capitalize on accessible Chinese resources in their pursuit of a clean energy transition, while continuing to diversify their renewable energy markets. Key ...

By addressing these areas, our project aims to contribute significantly to the sustainable development and energy security of Central Asia, positioning the region as a leader in ...

Central Asian countries should capitalize on accessible Chinese resources in their pursuit of a clean energy transition, while continuing to diversify their ...

Solar rotation is the rotation of the Sun about its own axis. The Sun is not a solid body, but is composed of a gaseous plasma, and different latitudes rotate with different periods.

The future efforts in our understanding of solar rotation will be focused on the precise determination of the rotation rate of the solar core, tachocline, near-polar regions, and the ...

In this study, the empirical orthogonal function (EOF) analysis, spectrum analysis, and correlation analysis are employed to reveal the ...

Internal rotation in the Sun shows differential rotation in the outer convective region and almost uniform rotation in the central radiative region. The transition between these regions is called ...

OverviewAxis of rotationSidereal rotationUsing sunspots to measure rotationInternal solar rotationSolar rotation is the rotation of the Sun about its own axis. The Sun is not a solid body, but is composed of a gaseous plasma, and different latitudes rotate with different periods. The solar rotation period is 25.67 days at the equator and decreases with increasing latitude, reaching 33.40 days at 75 degrees of latitude. The source of this differential rotation is an area of current research in solar astronomy.

This paper provided a comprehensive yet a concise overview of the potential, deployment, outlook, and barriers to renewable energy, including small-scale hydropower, ...

Based on a systematic review of the literature, this chapter provides a comprehensive overview of the profile and trajectory of research on energy in Central Asia ...

In this study, the empirical orthogonal function (EOF) analysis, spectrum analysis, and correlation analysis are employed to reveal the possible link between the summer ...

Hydroclimatic changes over arid central Asia (ACA) are not fully understood, primarily due to the paucity of accurate, high-resolution climatic records. Here we reconstruct hydroclimatic ...

As various countries converge to confront the challenges associated with traditional energy sources, the collective efforts to pivot towards solar power reflect a paradigm ...
