OverviewHistoryTheory of operationMaterialsEfficienciesProduction, cost and marketDurability and lifetimeEnvironmental and health impactThin-film solar cells are a type of solar cell made by depositing one or more thin layers (thin films or TFs) of photovoltaic material onto a substrate, such as glass, plastic or metal. Thin-film solar cells are typically a few nanometers (nm) to a few microns (um) thick-much thinner than the wafers used in conventional crystalline silicon (c-Si) based solar cells, which can be up to 200 um thick. Thin-film solar cells are commercially used in several technologies, including cadmium telluride (...)
