What are the components of a battery management system (BMS)?

The architecture of a BMS is generally divided into the following core components: 1. Cell Monitoring Each individual cell within a battery pack is closely monitored for parameters such as voltage, temperature, and state of charge (SoC).

Why do you need a battery management system (BMS)?

A well-designed BMS minimizes the wear and tear on the battery, leading to a longer operational life. For example, by preventing deep discharge or extreme overcharging, the BMS preserves the battery's capacity and avoids accelerated aging.

What happens if a battery does not have a BMS?

Without a proper BMS, batteries are more prone to overcharging, deep discharging, or operating in unsafe temperature ranges, all of which can degrade the battery, increase wear, and potentially cause catastrophic failure. 1. Safety

How should a BMS and battery be tested?

The BMS and battery should undergo test runs using the test modes implemented in the BMS and communicate with the test bench via common communication buses. It is recommended that a technical review of the BMS be performed for transportation, electrification, and large-scale (stationary) applications.
