What is site energy?

You're probably already familiar with site energy, which is the amount of heat and electricity consumed by a building as reflected in your utility bills. Looking at site energy can help you understand how the energy use for an individual building has changed over time.

What is the difference between source energy and site energy?

Source energy is the amount of primary energy consumed in supplying secondary energy to a building. The power generation, transmission, and delivery of source energy to the site results in losses. As a result, source energy is nearly always less efficient than site energy.

Why is site energy important?

Looking at site energy can help you understand how the energy use for an individual building has changed over time. Site energy may be delivered to a building in one of two forms: primary or secondary energy. Primary energy is the raw fuel that is burned to create heat and electricity, such as natural gas or fuel oil used in onsite generation.

How is site energy delivered to a facility?

Site energy may be delivered to a facility in one of two forms. Primary energy is the raw fuel that is burned to create heat and electricity, such as natural gas or fuel oil. Secondary energy is the energy product created from a raw fuel, such as electricity purchased from the grid or heat received from a district steam system.

Includes the primary energy (natural gas, petroleum products, and renewable energy) and the electricity used in the building. Includes small-scale solar electricity generated ...

Source energy is a measure that accounts for the energy consumed on site in addition to the energy consumed during generation and transmission in supplying the energy to your site.

If the customer has selected a supplier, the energy supply charges will come from the supplier and appear as a line item on the utility bill. If the customer doesn't choose a supplier, those ...

You may be familiar with site energy, the amount of heat and electricity consumed by a building as reflected in utility bills. Site energy may be delivered to a facility in one of two forms. ...

By having options for their energy provider, customers can have pricing and renewable/green choices for the electricity they consume. There are two types of retail choice: Community ...

You're probably already familiar with site energy, which is the amount of heat and electricity consumed by a building as reflected in your utility bills. Looking at site energy can help you ...

You're probably already familiar with site energy, which is the amount of heat and electricity consumed by a building as reflected in your utility bills. ...

When we talk about site energy, we're essentially discussing the total energy consumed right where it's used - think of it as the 'home cooking' version of power generation.

Includes the primary energy (natural gas, petroleum products, and renewable energy) and the electricity used in the building. Includes small-scale solar electricity generated and consumed ...

If the customer has selected a supplier, the energy supply charges will come from the supplier and appear as a line item on the utility bill. If the ...

Site energy refers to the amount of energy metered at the point of use (e.g. consumed by a building). Site energy may refer to both primary energy (natural gas or fuel consumed on site) ...

Site energy is the energy which is consumed at the final destination of the power generation cycle, and to simplify, is the amount of energy shown on a utility bill. It is the power ...

As Community Choice Aggregators (CCA), cities and counties may buy or generate electricity for residents and businesses within their communities. SCE partners with each CCA in our ...
